

The command `spanning-tree portfast` can be used to basically bypass the detection, but it can then cause loops. These are the global commands we set on access switches and if someone ...

Understand how switching loops are created and learn the best practices for preventing them using the spanning tree protocol and portfast mode.

The loop-protect feature should help to be able to detect a loop caused by connecting network-devices which do filter bpdu"s in the wrong way - as the loop-protect packets will be ...

Yes, vlans can split up broadcast domains, but a storm will still cause issues on any switch that vlan extends through, including your core. Switches usually have some kind of additional ...

Below are few links you can refer and they help address loop related issues in the network. [Configuring RSTP \(802.1w\) and Spanning Tree Best Practices on ICX Switches](#)

We recommend that you enable loop protection on all switch interfaces that have a chance of becoming root or alternate ports. Loop protection is most effective when enabled in the entire switched network.

I'm running into a problem where i have a setup of several access cabinets connected via a star topology to core switch, access switches are icx 7150 and 7250 and core is 2 stacked 7650. ...

Switching loops can cause misleading entries in a switch"s media access control (MAC) database and can cause endless unicast frames to be broadcast throughout the network.

To stop a network loop, enable the Spanning Tree Protocol (STP) or Rapid Spanning Tree Protocol (RSTP) on your switches to ensure a loop-free topology. Utilize switch features like BPDU Guard, ...

Looking for some advice on what would be the best approach to prevent physical loops at the access layer. Our existing design is quite simple, it consists of several switches acting as layer 2 ...
