

# Difference between flat-top and pointed pigtails

Ballistic tip bullets favor both hunters and competitive shooters as they provide greater accuracy and combine the lethal characteristics of hollow point and soft point bullets. We will explore ...

In this guide, we will break down what fiber optic pigtails are, how they differ from patch cords, what types exist, and how to select the right one for your project. By the end, you will have a ...

Among the different types of projectiles, flat-nose and round-nose bullets are common designs, especially in Full Metal Jacket (FMJ) configurations. These shapes can significantly affect ...

A flat-headed bullet inherently has more wind resistance than a pointy bullet. However, there are still situations where a hollow point round proves more useful than ball ammunition.

Instead of using a hard and pointy polymer tip, Hornady used a soft--malleable--pointy tip. This allowed ammunition loaded with these bullets to fly flatter due to a higher ballistic coefficient, and they could ...

The main difference between flat-nosed and round-nosed full metal jacket (FMJ) bullets lies in the shape of the bullet tip or nose. These differences can affect the bullet's external ballistics, ...

Flat point bullets differ from round nose designs primarily in their terminal performance characteristics. The blunt, flat tip transfers energy more efficiently upon impact compared to rounded profiles that ...

A flat nose bullet has a flattened or truncated cone-shaped tip, while a hollow point bullet has a cavity in its tip designed to promote expansion upon impact. Both designs aim to enhance ...

Among the different types of projectiles, flat-nose and round-nose bullets are common designs, especially in Full Metal Jacket (FMJ) configurations. ...

JFP (Jacketed Flat Point): Jacketed flat point rounds have a flat area of exposed lead at the tip. JSP (Jacketed Soft Point): Jacketed soft point bullets usually have a spire pointed tip of ...

Besides having a pointed nose section the Balle D was also the first military rifle projectile that had a boat tail - a streamlined tapered base - to further minimize air resistance in flight.
