

In an achromatic beam splitter, both beams have identical SPD. In a colour-sensitive beam splitter, one part of the spectrum is reflected while the other part is transmitted and the two beams vary in SPD.

This article will review diffractive beam splitter operating principles, their advantages for quantum technologies, and some typical quantum optical ...

Beam splitters are devices for splitting a laser beam into two or more beams. There are different types, including polarizing and non-polarizing versions.

However, due to the high refractive index contrast of silicon-on-insulator platforms, state-of-the-art nanophotonic splitters are hampered by trade-offs in bandwidth, polarization dependence...

Having said that, the polarization maintaining fused splitters currently available on the market have a narrower operating bandwidth and often demonstrate mediocre polarization extinction ratio ...

The beam splitter based on MMI coupling principle is a more mainstream beam splitting method in recent years. Compared with the above y-branch splitter, it is not limited by the radiation ...

To reduce loss of light due to absorption by the reflective coating, so-called 'Swiss-cheese' beam-splitter mirrors have been used. Originally, these were sheets of highly polished metal perforated with ...

This paper proposes a polarization beam splitter operating at terahertz frequencies. The beam splitter utilizes cyclo-olefin copolymer as the material and introduces two hollow elliptical structures to divide ...

Once the construction type, basis of separation, and bandwidth have been determined, there may still be several beamsplitter types from which to choose. The decision is then based on factors like split ...

Diffractive beam splitters are flat, thin optical elements that can generate an array of output beams from an input laser beam, with precise separations and pre-designed power ratios.

A polarization beam splitter based on a dual hollow-core anti-resonance fiber structure is proposed. The optimal propagation length of the polarization beam spl.

I'd suggest that unless you're right on the cutoff edge of a sharp splitter, you will see essentially no variation in the transmittance over the spectral range of your pulse.
