

# How do I switch the fiber optic cable to red light source mode

With the knowledge provided in this comprehensive guide, you're well on your way to becoming a VFL expert, ready to tackle any fiber optic challenges that come your way.

The button at the top of the device (with a red ring around it) is the on-off switch. Once we turn it on, we can use the mode-switch button (at the middle of the device) to switch between two modes: the ...

Turn on the optical visual fault locator. Most VFLs have a button or switch to turn on the light. You should see a visible red light coming from the fiber. Carefully inspect the entire length of ...

This device emits a red light inside the cable, making any breaks visible. Connect the cable to the laser, switch it on, and observe. If light escapes from the cable at any point other than ...

VisiFault emits a bright beam of red light easily visible from a distance. Connect the VisiFault to one end of a fiber then locate that fiber at the other end, even if it one of many fibers either in a cable or terminated in a rack.

Use the default continuous mode to check continuity or find a break, as it shows a steady light traveling through the fiber. If you need to identify cables in a patch panel or a bundle, switch to ...

Learn how to use a fiber optic visual fault locator (VFL) to find and fix faults in fiber optic cables. A VFL is a simple and effective tool for fiber optic troubleshooting.

A Visual Fault Locator (VFL) can help verify this polarity by sending the visible red laser light through the fiber and tracking its path to the other end of the fiber cable connector.

If there is a red light leakage somewhere, turn on the flashing mode of the visual fault locator (push down), and quickly find out the fault point of the fiber optic jumper through the flashing light.

It is a cost-effective way to spot defects of fiber glass such as sharp bends, breaks, faulty connectors and other faults which will "leak" red or green light visually. It can also locate the fault of ...
